

Replacing Convactor Heaters

Hanson Cement

The Job: Replace four old convactor heaters and install one new complete heater with power supply.

Hanson Concrete is the UK's largest supplier of ready-mixed concrete from a National network of 178 static and mobile production plants.

The works below were carried out at the Scunthorpe Technical Centre where Hanson carry out the majority of their testing of concrete products. We have done many works at this location and the example below is typical of many works carried out each year.

We were asked by Hanson Scunthorpe to provide a quotation to replace four old convactor heaters that were life expired and also to fit a new heater in the reception area.

On acceptance of our quotation, materials were placed on order and once stock was available it was collected and our technician dispatched to site. After completing a risk assessment, the four old heaters were removed and replaced with the new units and then tested. A new power supply complete with a localised isolation was run to the location where the reception heater was to be installed.

The heaters were installed, wired and tested with a completion certificate issued to the Partner.
